VARIABLE ATTENUATOR

Ideal for transceiver testing and system verification in demanding 24/7 production environments.

KEY FEATURES

Outstanding spectral uniformity

Ideal for BER testing and system verification

Integrated power monitoring options (on both singlemode and multimode models), for easy power setting and improved stability

Designed for 24/7 production, with minimal maintenance

Fast settling time for optimized efficiency

A FULLY PROGRAMMABLE SOLUTION

Network equipment manufacturers and transceiver manufacturers know that variable attenuators are essential components of their test systems. They look for performance, user-friendliness, complete control of test parameters and advanced programming capability. EXFO's FTBx-3500 variable attenuator combines innovative design techniques, high-quality components and meticulous calibration procedure.

With or without the power monitoring option, the FTBx-3500 module occupies just a single slot.

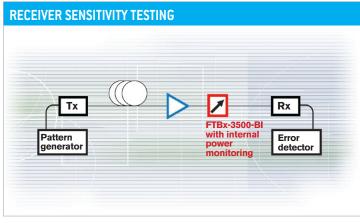

Option: Automatic power monitoring

The power monitoring option allows the attenuator output power level to be set directly. When enabled, this function ensures power stability, even if the source power fluctuates. This option also simplifies test setups, eliminating the need for an external power meter.

Rugged and reliable

Flexible, fully programmable and built for both singlemode and multimode applications, the FTBx-3500 features an extremely rugged design allowing 24/7 operation for years without maintenance.

The attenuating filter technology used in the FTBx-3500 makes it ideal for multimode BER and transceiver testing.

Typical receiver sensitivity setup

Featuring integrated power monitoring, the FTBx-3500-BI allows you to precisely control the amount of power your receiver (Rx) under test detects, thereby enabling you to achieve proper BER measurements. The FTBx-3500-CI or FTBx-3500-DI enable similar characterization for multimode applications.

When calibrating your system, you can choose between two offsets. The first is wavelength-independent and can be used to account for loss in the test setup, if applied to the attenuation or power setting. The second offset acts as a calibration factor, ensuring wavelength-specific correction levels and compensating for loss due to patchcords and connectors.

- a. At 23 °C ± 1 °C.
- b. At 1550 nm and below.
- c. Measured at 1310 nm and 1550 nm for singlemode units, measured at 850 nm for multimode units.
- d. Excluding connectors.
- e. Measured at 1310 nm and 1550 nm (up to 40 dB) for singlemode units and at 850 nm and 1300 nm (up to 45 dB) for multimode units, with non-polarized light.
- f. Up to 40 dB attenuation.
- g. For 20 dB attenuation, relative to 0 dB attenuation.
- h. At 1550 nm, after a 30-minute warm-up and an offset nulling, for an input power between 20 dBm and -40 dBm.
- i. Up to 20 dB attenuation at 1550 nm.
- j. For FC/APC connectors.
- k. Including platform processing time.
- I. At 1300 nm, after a 30-minute warm-up and an offset nulling, for an input power between 17 dBm and -40 dBm.
